GENERAL INFORMATION:

APPLICANT: Sato, Taka-Aki

TITLE OF INVENTION: METHOD OF PREPARING A PROTEIN ARRAY BASED ON

TITLE OF INVENTION: BIOCHEMICAL PROTEIN-PROTEIN INTERACTION

FILE REFERENCE: 65823/JPW/PT

CURRENT APPLICATION NUMBER: US/10/092,138

CURRENT FILING DATE: 2002-09-06

NUMBER OF SEQ ID NOS: 33

SOFTMARE: Patentin Ver. 2.1

SEQ ID NO 9

LENGTH: 6

TYPE: PRT

ORGANISM: Artificial Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   밁

The composition can be used to inhibit the proliferation of cancer or virally infected cells, or induce apoptosis in cancer or virally
             cyclosporin by transforming a vector containing this sequence to a recombinant host. This allows effective production

                                                                                                                                                                                                                                                                             of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    New nucleic acid that is a 5' expressed sequence obtaining cDNAs and genomic DNAs that correspond diagnostic, forensic, gene therapy and chromosome
                                                                                                                                                                                                       Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins.                                                                                                                                   The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC genes themselves and the encoded proteins. The prokaryotes used are CC genemoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used CC inventify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen CC programmes. The antisense nucleic acid sequence is also useful to screen CC a wide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.

CC The protein acids which are required for cell proliferation in CC essential prokaryotic cellular proliferation protein.

CC fine printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           SX
                                                                                                                                                                                                                                                                                                                       attenuated virulence were identified in a mouse model of bacteraemia. The nucleotide sequences of regions flanking the transposon insertion sites of these mutants were determined, and database sequence comparisons were performed to identify these virulence genes (see AAX07088-136) and the possible function of their protein products (see AAX07680-724). The P10C15 virulence gene product comprises the Cee AAX07680-136) and the possible function of their protein products of spartate semialdehyde dehydrogenase, a first ORF of P10C15 encodes the C-terminus of the aspartokinase 2 alpha subunit (see AAX07680). Both enzymes are involved in homoserine biosynthesis. A claimed method of identifying an antibacterial agent involves assaying potential agents for the ability to interfere with the expression of S. aureus virulence gene products. Also new is a S. cureus organism containing a functional mutation in one of the virulence genes, and its use in vaccine compositions.
                                                                                                                                                                                                                          Query Match

                                                                                                                                                                                                                                                                                        The invention relates to antisense inhibitors of genes essential to CC prokaryotic cellular proliferation, their use in identifying the CC genes, their use in the discovery of novel antibiotics, the essential CC genes themselves and the encoded proteins. The prokaryotes used are CC Escherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella CC pneumoniae, Pseudomonas aeruginosa and Enterococcus faecalis. The CC invention is also useful for the identification of potential new targets CC for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, CC and to obtain antibodies capable of binding to the expressed proteins. CC The proteins can be used to screen compounds in rational drug discovery CC programmes. The antisense nucleic acid sequence is also useful to screen compounds in roteins can be used to screen compounds in represents an CC awide variety of organisms. The present sequence represents an CC essential prokaryotic cellular proliferation protein.

CC Note: The sequence data for this patent did not form part CC format directly from WIPO at CC sequences.
                                                                                                                                                                                                      Query Match

The S. epidermidis sequences have antibacterial activity and can be used in gene therapy. The sequences can also be used in the diagnosis and treatment of bacterial infections, particularly S. epidermidis infections. The sequences can be used to screen for compounds able to interfere with the S. epidermidis life cycle or inhibit S. epidermidis infection.

N.B. The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the

The Gi proteins are involved in hormonal inhibition of adenylyl cyclase and the regulation of plasma membrane enzymes. In addition, G-alpha-i3 has been shown to have a role in the dopamine, throctropin-releasing hormone and somatostatin signal transduction pathways. The specification describes a number of antisense oligonucleotides which modulate the expression of
New antisense compounds targeting nucleic acids encoding human G-alpha-il useful for modulating G-alpha-il expression and for treating diseases associated with G-alpha-il expression -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC This sequence represents the human G-alpha-il amino acid sequence. Human CC G-alpha-il is a member of the Gi subfamily of G proteins which is CC involved in hormonal inhibition of adenylyl cyclase and in the CC regulation of plasma membrane enzymes. The expression of G-alpha-il is CC altered in some tumours. The invention relates to antisense CC oligonucleotides represented in ANA10814-A10853 which inhibit the CC expression of G-alpha-il. The antisense oligonucleotides can be used in CC the treatment of diseases or conditions associated with the expression of G-alpha-il by modulating the expression of G-alpha-il in cells or CC tissues. The antisense compositions may also be used prophylactically, CC e.g. to prevent or delay infection, inflammation, or tumour formation. CC Furthermore, the antisense oligonucleotides may also be useful in CC research and diagnostics, e.g. in detecting nucleic acids encoding CC G-alpha-il by conjugation of an enzyme to the oligonucleotide, or cradiolabelling the oligonucleotide. Kits using such detection means for detecting the level of G-alpha-il in the sample may also be prepared. Antisense oligonucleotides, which are able to inhibit specific gene expression, are often used to elucidate the function of particular genes. These antisense compounds are also used to distinguish between functions of various members of a biological pathway.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                                                                                                                                                                                                         The present invention describes a prodrug comprising a vector encoding a G-protein coupled receptor (GPCR). This can be used in the treatment of diseases, including hormone-dependent cancers, cardiovascular, nervous system, digestive system, immune system, respiratory, skeletal, endocrine, sensory and muscle diseases and disorders. The present sequence is a protein described in the exemplification of the invention.

                                                                                                                                                                                                                                                                                                                      The present invention describes a nucleic acid sensor molecule (I) comprising a target molecule activation site comprising a structure that recognises a target molecule and an optical signalling unit including at least one nucleotide coupled to a signalling molecule including at the compile of the target molecule. (I) is useful for identifying a pathological condition of (I) following (I) is useful for identifying a drug compound, by identifying a nucleic acid biosensor-based molecule profile of target molecules associated with a pathological condition or genetic alteration. (C) acid biosensor-based molecule profile of target molecules associated with a disease trait in a patient, administering a candidate compound to the patient, and monitoring changes in the profile. Alternately, the method convolves identifying a number of pathway target molecules, administering a candidate compound to a patient having a disease trait, and monitoring changes in the structure, level or activity of two or more of the pathway target molecules or the compared to the profile of target molecules or the compared to the profile of target molecules or the compared to the profile of a reference companies in the structure is compared to the profile of a reference detection of target molecule. (I) is also useful in multiple assays, for the applications and drug optimisation. The present sequence represents a comparation.
                                                                                                                                밁

                                                                                                                                                                                                                    á
                                                                                                                                                                                                                                                                                                                                                                                                     CC comprising a target molecule activation site comprising a structure that CC recognises a target molecule and an optical signalling unit including at CC least one nucleotide coupled to a signalling molety that changes its CC optical properties upon allosteric modulation of (1) following CC optical properties upon allosteric modulation of (2) following crecognition of the target molecule. (1) is useful for identifying a pathological condition or genetic alteration. (CC (1) is useful for identifying a farget molecules associated with a patient, and monitoring changes in the profile of target molecules associated with CC addsease trait in a patient, administering a candidate compound to the Qualtent, and monitoring changes in the profile. Alternately, the method CC involves identifying a number of pathway target molecules, administering CC acandidate compound to a patient having a disease trait, and monitoring CC acandidate compound to a patient having a disease trait, and monitoring CC arget molecules using (1). The profile of target molecules or the CC changes in the structure is compared to the pathway target molecules or the CC changes in the structure is compared to the pathway target molecules or the CC changes in the structure is compared to the pathway target molecules or the CC changes in the structure is compared to the profile of a reference companies of target molecule. (1) is useful in multiple assays, for the detection of target molecule. (1) is also useful in diagnostic
                                                                                                                                                                                                                                                     Best Local Similarity

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to G protein-coupled receptors (GPCRs) for who the endogenous ligand has been identified. Non-endogenous constitutively activated versions of known GPCRs are used in the invention for the direct identification of candidate compounds as receptor agonists, inverse agonists or partial agonists. Such agonists are useful as therapeutic agents for diseases or disorders associated with GPCRs. The present sequence is a GPCR fusion protein containing thyroid stimulating hormone receptor (TSHR).

This can be used in the treatment of diseases, including hormone-dependent cancers, cardiovascular, nervous system, digestive system, immune system, respiratory, skeletal, endocrine, sensory and muscle diseases and disorders. The present sequence is a protein described in the exemplification of the invention.
                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Disclosure; Page 30-31; 78pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Use of a vector encoding G-protein coupled receptors for manufacturing medicaments for treating cancer, diseases of cardiovascular system, nervous system, digestive system, immune system, or muscle diseases -

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).

-I- FUNCTION: Guanine nucleotide-binding proteins (G p involved as modulators or transducers in various t signaling systems. G(k) is the stimulatory G proteres regulated K(+) channels.

-I- SUBUNIT: G proteins are composed of 3 units (alpha gamma). The alpha chain contains the guanine nucle
                                                                                                                                                                                                                                                                                                                                                              EMBL; M20597; AAA35895.1; JOII

                                                                                                                                                                                                                                                                                            protein gene expression during mouse protein gene expression during mouse
                                                SUBUNIT:
                                                                                   FUNCTION: Guanine nucleotide-binding proteins (G proteins) are involved as modulators or transducers in various transmembrane signaling systems. G(k) is the stimulatory G protein of receptor regulated K(+) channels (By similarity)
                                                                                                                                                                                                                                                     Reprod. Dev. 44:315-323(1996)

RT "Inhibitory guanine-nucleotide-binding-regulatory protein alpha
RT gubunite in medaka (Oryzias latipes) occytes -- cDNA cloning and
RT decreased expression of proteins during oocyte maturation.";

RL Bur. J. Biochem. 249:846-853(1997).

CC -!- BIOCHEMS. GUANINE NUCLEOTIDE-BINDING PROTEINS (G PROTEINS) ARE
CC -!- FUNCTION: GUANINE NUCLEOTIDE-BINDING PROTEINS ARE INVOLVED IN HORMONAL
CC SIGNALING SYSTEMS. THE G(I) PROTEINS ARE INVOLVED IN HORMONAL
CC REGULATION OF ADENYLATE CYCLASE: THEY INHIBIT THE CYCLASE IN
CC RESPONSE TO BETA-ADRENERGIC STIMULI.
CC RESPONSE TO BETA-ADRENERGIC STIMULI.
CC -!- SUBUNIT: G PROTEINS ARE COMPOSED OF 3 UNITS, ALPHA, BETA AND
CAMMA. THE ALPHA CHAIN CONTAINS THE GUANINE NUCLEOTIDE BINDING

Chem. 273:21752-21758 (1998).

FUNCTION: GUANINE NUCLEOTIDE-BINDING PROTEINS (G PROTEINS) ARE INVOLVED AS MODULATORS OR TRANSDUCERS IN VARIOUS TRANSMEMBRANE SIGNALING SYSTEMS.

FUNCTION: THE G(I) PROTEINS ARE INVOLVED IN HORMONAL REGULATION OF PUNCTION: THE G(I) PROTEINS ARE INVOLVED IN RESPONSE TO BETA-ADRENERGIC STIMULI.

SUBUNIT: G proteins are composed of 3 units (alpha, beta and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          gamma)

C;Comment: The G proteins are a family of guanine nucleotide-binding proteins that relay ains. The beta and gamma chains, required for GFDase activity, appear to be common to all rase; it is specific for each type of G protein.
C;Comment: The Gi alpha chain is specific for G protein that is involved in hormonal rec;Superfamily: GTP-binding regulatory protein Gs alpha chain
